Yandex, 2017–2025

Product designer

Yandex.Forms

A full redesign on a tight deadline, with limited engineering resources.

- Ran the research: interviews, and UX testing of prototypes both in sessions and in Pathway.
- Moved the service onto the company-wide design system.
- Worked with metrics: analyst exports and Yandex.Metrica.
- Rebuilt form creation from the ground up.
- Redesigned the theme settings, built new theme presets and rewrote the theme editor completely.
- Streamlined the forms list and gave it real functionality: several view modes, grouping, favorites. People can finally set it up their own way and have it stick — which never worked before.
- Redesigned the form styles respondents see. The finished form is now consistent and flexible through themes. Wrote a detailed guide for the developers.

Result: single-page forms are created about **a minute faster** on average, **themes are customized 1.5× more often**, feedback is positive and the number of published forms is up. Support requests went down.

Yandex.Travel

Owned the hotel page in Hotels, and the whole of Trains and Buses. Took part in building the unified portal and its design system.

- Built the portal design system together with designers from the other verticals.
- Redesigned Trains. Spent a lot of time on checkout: seat selection with prices and discounts right on the carriage plan, and fast form filling from saved presets. **Sales went up**, people get through the **new checkout faster** and make fewer mistakes along the way.
- Designed a single cart for every Travel vertical, with customization built into each of its blocks.

- Redesigned Buses. Reusing the patterns from Trains kept development fast, nobody struggled with the result, and there is far more information about route specifics and how to buy a ticket. Support requests dropped and sales started to grow.
- Looked after the Suburban Trains app: added ticket sales, delay and transfer information. Built its design system — the app had gone a long time without a dedicated designer and the developers had piled up a lot of redundant styles. There was plenty of cleanup on the existing screens too. I also organized and ran a hackathon for a small feature people kept asking for: the weather. In half a day we had a working prototype, and it shipped in the next release.
- Designed the MVP for Hotels. The launch went well.
- Redesigned hotel reviews: pros and cons, photo uploads, and a summary of what people wrote. I took the summaries used on Yandex Search and Maps as a starting point and adapted them to our design system and data.
- Across every product I either briefed the UX team or ran the research myself: surveys, UX tests, side-by-side comparisons and so on.

Kontur, 2012–2017

Product designer

Billing

Designed billing and a CRM for the sales teams and partners from scratch. The case is written up at <https://mokhova.github.io>

- Ran depth interviews and field research: travelled across Russia to service centers to watch the work happen, and sometimes took a shift as a sales manager myself.
- Built a design culture in the team: how to judge design, when and why a designer is needed, how to measure what design changed.
- Set up and analyzed Google Analytics and Yandex.Metrica myself.
- Made prototype testing routine: I put the link right inside the product and read the results from session recordings, event parameters in Yandex.Metrica and a short survey. 70% of users filled it in. I gave a talk about it at the DUMP conference, and with colleagues we turned it into a product, UXPeriment.
- Hired and grew my own design team.
- Brought animation into a strict B2B product. Built code prototypes for the developers.

Staff

Built the MVP of a new employee directory, integrated with the other internal services, with personal blogs and social features.

- Gathered the requirements and analyzed the existing metrics.

- Built the concept and tested it.

Result: Staff took second place in the “Best HR solution 2013” category at Best Intranet Russia.

Jetstyle, 2010–2011

Designer, web analyst

Gathered requirements for the designer, built prototypes, ran interviews and analyzed metrics. Audited websites.

- <http://сваи.пф> — interface design for a manufacturing plant.
- <http://www.superstroy.ru> — interaction design and analytics for a large wholesale building-materials supplier.
- <http://novosel99.ru> — requirements and audience analysis, briefing, design of the search results.
- <http://chtd.ru> — requirements and audience analysis, interaction design.
- <http://mayamotors.ru> — requirements analysis, the design brief, defining the metrics.
- Website of the Legislative Assembly of Sverdlovsk Region: requirements, audience and metrics analysis, interaction design, some of the visual design.
- Helped rebuild the Yandex.Schedules search results and its admin panel.

Skills

- Interviews, surveys, field and UX research
- Figma: auto layout, components, variables
- JTBD, CJM, user flows
- HTML/CSS/JS for specs, animation and prototyping
- Setting up and analyzing metrics (Google Analytics, Yandex.Metrica)
- Tilda: zero block + code
- AI: Nano Banana, Midjourney, ChatGPT, Perplexity
- Languages: English — Advanced, French and German — Intermediate, Japanese — N4, Chinese — HSK2

Education

Applied Mathematics

Ural Federal University named after the first President of Russia B. N. Yeltsin, Yekaterinburg

2014 · Bachelor's degree

Courses

UI course “Drawing with Vika”

2024 · Vikki Breusova

JavaScript Basics

2017 · HTML Academy

Information Style and Copy Editing

2017 · Maxim Ilyahov

“Typography and Layout”

2015 · Igor Shtang

Data Visualization

2015 · Tanya Misyutina

“Comaking Products People Love”

2013 · Jeff Patton, Comakers
